Project Design Phase

Proposed Solution Template

Date	29 October 2026
Team ID	
Project Name	FreelanceHub — MERN Stack Freelancing Platform
Maximum Marks	2 Marks

Proposed Solution Template

S.No.	Parameter	Description
1.	**Problem Statement (Problem to be solved)**	Early-career freelancers struggle to find suitable open projects and get clear feedback on their applications, while clients struggle to compare proposals and communicate with the freelancer they choose — because hiring is spread across scattered emails, messages and spreadsheets.
2.	**Idea / Solution description**	FreelanceHub is a full-stack MERN application — a React (Vite) frontend, an Express/Node.js backend in the MVC pattern, and MongoDB Atlas for storage — where clients post projects, freelancers browse and apply with a proposal, rate and portfolio link, clients approve or reject applications, and approved pairs collaborate through a real-time Socket.io chat.
3.	**Novelty / Uniqueness**	Instead of stopping at a list of jobs, FreelanceHub ties the hiring decision directly to collaboration: the application status (Pending, Approved, Rejected) is part of the same data model as the chat, so approving a freelancer is what unlocks the conversation. Role-based JWT access for Client, Freelancer and Admin keeps the whole flow secure and simple in one codebase.
4.	**Social Impact / Customer Satisfaction**	Early-career freelancers get a fair, transparent way to find work and build a reputation, and always know where each application stands. Small businesses get a simple way to hire and manage talent without chasing proposals across different apps, which saves time and reduces confusion on both sides.
5.	**Business Model (Revenue Model)**	The platform could earn a small commission on completed projects once online payments and escrow are added, offer paid featured project listings for clients, or provide a premium subscription tier with extra tools for frequent clients and freelancers.

S.No.	Parameter	Description
6.	**Scalability of the Solution**	The Express API is stateless (JWT-based authentication with no server-side session storage), so it can scale horizontally behind a load balancer. MongoDB Atlas managed clusters scale independently of the application layer as users, projects and applications grow, and the Socket.io layer can be scaled out with a shared message adapter. Cloud deployment on platforms like Render and Vercel is the planned next step.
